

Product Information

Stabilac Silage Inoculant

What it is:

- A dry silage inoculant that is completely water soluble.
- Contains live lactic acid producing bacteria needed for rapid silage fermentation and nutrient preservation.
- Designed for all forage materials that are cut and ensiled immediately.

How it is used:

- Dissolve one 2.2 pound canister of inoculant in 25 gallons of water (dilute). The diluted inoculant can be applied immediately or covered at room temperature for 24 hours with occasional stirring.
- Apply 1 quart of solution per ton of forage or high moisture coarsely ground or cracked grain at the chopper, unloader or blower.
- Recommended for forage with moisture levels of 50-70%, or for high moisture grains with moisture levels of 25-35%

Management Tips:

- Determine the moisture level of the forage or high moisture grain with an accurate, approved moisture tester.
- Use an accurate, recommended applicator for uniform coverage. Rinse applicator equipment thoroughly after each use.
